

SET COVERING MACHINE FOR SNPs DISCOVERY

Vivien Goepf

March, 23rd 2020

CBIO Meeting

1. Short reminder on GWAS

- **Goal:** Discover gene mutations *linked* to a disease.
- GWAS will not provide: causality relations or biological understanding of a disease.
- Applications to common diseases:
 - ▶ Inflammatory Bowel Diseases
 - ▶ Auto-immune diseases
 - ▶ Metabolic diseases (T2 diabetes, obesity, BMI)
 - ▶ Multiple sclerosis
 - ▶ Cancer

The CD/CV hypothesis

- *Common diseases* are partly caused by *common variants*
- Consequence: each mutation can only have a *small effect*

Source: Bush et al (2012)

Linkage disequilibrium (LD): correlation between close-by alleles on the genome

Source: Bush et al (2012)

Idea of using single nucleotide polymorphisms (SNPs):

- SNP: Single nucleotide polymorphism
- There are many high-LD blocks on the genome
- We can use SNPs as markers of an LD block

- Gather $n \sim 10^3$ individuals
- Observe the phenotype:
 - ▶ quantitative (BMI, cholesterol, height)
 - ▶ or qualitative (case-control for common disease).
- Observe the genotype of $p \sim 10^6$ SNPs

- Gather $n \sim 10^3$ individuals
- Observe the phenotype:
 - ▶ quantitative (BMI, cholesterol, height)
 - ▶ or qualitative (case-control for common disease).
- Observe the genotype of $p \sim 10^6$ SNPs

Source: Ikram et al (2010)

- Epistasis: “The masking of the effects of one variant by another” (Bateson 1909).

Epistasis and interactions between SNPs

- Epistasis: “The masking of the effects of one variant by another” (Bateson 1909).
- Examples

Redundancy

Positive interactions in linear pathways

Examples of biological causes for epistasis (Source: Lehner 2011)

Epistasis and interactions between SNPs

- Epistasis: “The masking of the effects of one variant by another” (Bateson 1909).
- Examples

Redundancy

Positive interactions in linear pathways

Examples of biological causes for epistasis (Source: Lehner 2011)

- The genetic mutations are in interaction
- Need to consider SNPs *jointly*

We do **feature selection** with:

- $\frac{p}{n} \sim 1000$

We do **feature selection** with:

- $\frac{p}{n} \sim 1000$
- Correlation between features (SNPs)

We do **feature selection** with:

- $\frac{p}{n} \sim 1000$
- Correlation between features (SNPs)
- Interaction between features

The statistical problem

We do **feature selection** with:

- $\frac{p}{n} \sim 1000$
- Correlation between features (SNPs)
- Interaction between features

Very small statistical power

2. Set covering machines for SNPs discovery

Encoding of SNP alleles

Each SNP has value $\in \{aa, aA, AA\}$.

Genotype	Dominant	Recessive	Allelic dosage	One-hot
aa	0	0	0	100
aA	1	0	1	010
AA	1	1	2	001

Encoding of SNP alleles

Each SNP has value $\in \{aa, aA, AA\}$.

Genotype	Dominant	Recessive	Allelic dosage	One-hot
aa	0	0	0	100
aA	1	0	1	010
AA	1	1	2	001

We will use one-hot encoding \rightarrow binary features

Setting of the set covering machine (SCM)

- $y_i \in \{0, 1\}$ (case/control GWAS)
- $x_{i,j} \in \{0, 1\}$ (one-hot encoding)
- $p \gg n$ with true model assumed to be *very sparse*

Setting of the set covering machine (SCM)

- $y_i \in \{0, 1\}$ (case/control GWAS)
- $x_{i,j} \in \{0, 1\}$ (one-hot encoding)
- $p \gg n$ with true model assumed to be *very sparse*

- SCM **learns a boolean function** of the features:

$$f(\mathbf{x}) = \bigwedge_{j \in \mathcal{R}} h_j(\mathbf{x}),$$

where $\mathcal{R} \subseteq$ is the set of rules to learn.

- Here a rules h_j is the one-hot encoding of a SNP.

Setting of the set covering machine (SCM)

- $y_i \in \{0, 1\}$ (case/control GWAS)
- $x_{i,j} \in \{0, 1\}$ (one-hot encoding)
- $p \gg n$ with true model assumed to be *very sparse*

- SCM **learns a boolean function** of the features:

$$f(\mathbf{x}) = \bigwedge_{j \in \mathcal{R}} h_j(\mathbf{x}),$$

where $\mathcal{R} \subseteq$ is the set of rules to learn.

- Here a rules h_j is the one-hot encoding of a SNP.
- SCM only learns a **conjunction** of SNPs to explain the phenotype.

Haussler algorithm:

- Assume there is a combination of features that perfectly classifies the dataset: $\mathbf{y} = \bigwedge_{j \in \mathcal{R}} h_j$
- How to find the sparsest possible combination of features?
- Only consider rules that correctly classify *all* positive examples ($y_i = 1$).

The set covering problem (2/2)

- Example: what conjunction of h_j s equals \mathbf{y} ?

	\mathbf{y}	h_1	h_2	h_3	h_4
	0	0	0	1	1
\mathcal{N}	0	1	0	0	1
(negative examples)	0	1	1	0	0
	0	1	1	1	0
	1	1	1	1	1
\mathcal{P}	1	1	1	1	1
(positive examples)					

The set covering problem (2/2)

- Example: what conjunction of h_j s equals \mathbf{y} ?

	\mathbf{y}	h_1	h_2	h_3	h_4	$h_2 \wedge h_3$
\mathcal{N}	0	0	0	1	1	0
	0	1	0	0	1	0
	0	1	1	0	0	0
	0	1	1	1	0	0
\mathcal{P}	1	1	1	1	1	1
	1	1	1	1	1	1

The set covering problem (2/2)

- Example: what conjunction of h_j s equals \mathbf{y} ?

	\mathbf{y}	h_1	h_2	h_3	h_4	$h_2 \wedge h_3$
\mathcal{N}	0	0	0	1	1	0
	0	1	0	0	1	0
	0	1	1	0	0	0
	0	1	1	1	0	0
\mathcal{P}	1	1	1	1	1	1
	1	1	1	1	1	1

- Smallest number of sets $\{1\}, \{1, 2\}, \{2, 3\}, \{3, 4\}$ whose union is $\{1, 2, 3, 4\}$.

The set covering problem (2/2)

- Example: what conjunction of h_j s equals \mathbf{y} ?

	\mathbf{y}	h_1	h_2	h_3	h_4	$h_2 \wedge h_3$
\mathcal{N}	0	0	0	1	1	0
	0	1	0	0	1	0
	0	1	1	0	0	0
	0	1	1	1	0	0
\mathcal{P}	1	1	1	1	1	1
	1	1	1	1	1	1

- Smallest number of sets $\{1\}, \{1, 2\}, \{2, 3\}, \{3, 4\}$ whose union is $\{1, 2, 3, 4\}$.
- This is the set cover problem (NP hard)

The set covering problem (2/2)

- Example: what conjunction of h_j s equals \mathbf{y} ?

	\mathbf{y}	h_1	h_2	h_3	h_4	$h_2 \wedge h_3$
\mathcal{N}	0	0	0	1	1	0
	0	1	0	0	1	0
	0	1	1	0	0	0
	0	1	1	1	0	0
\mathcal{P}	1	1	1	1	1	1
	1	1	1	1	1	1

- Smallest number of sets $\{1\}, \{1, 2\}, \{2, 3\}, \{3, 4\}$ whose union is $\{1, 2, 3, 4\}$.
- This is the set cover problem (NP hard)
- We use a greedy approach

We choose the rule with maximum usefulness:

$$U_h = |\mathcal{A}_h| - q|\mathcal{B}_h|,$$

\mathcal{A}_h : negative examples correctly classified

\mathcal{B}_h : positive examples uncorrectly classified

We choose the rule with maximum usefulness:

$$U_h = |\mathcal{A}_h| - q|\mathcal{B}_h|,$$

\mathcal{A}_h : negative examples correctly classified

\mathcal{B}_h : positive examples uncorrectly classified

- We allow errors on positive examples
- q controls this error

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
<hr/>					
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2
	$ \mathcal{B}_h $	0	2	1	0

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2
	$ \mathcal{B}_h $	0	2	1	0
	\mathcal{U}_h	1	0	1	2

Set covering machine: example

Example (with $q = 1$):

	y	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
<hr/>					
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2
	$ \mathcal{B}_h $	0	2	1	0
	\mathcal{U}_h	1	0	1	2

- $\mathcal{R} \leftarrow \{h_4\}$

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2
	$ \mathcal{B}_h $	0	2	1	0
	\mathcal{U}_h	1	0	1	2

- $\mathcal{R} \leftarrow \{h_4\}$
- $\mathcal{N} \leftarrow \mathcal{N} \setminus \mathcal{A}_{h_4}$

Set covering machine: example

Example (with $q = 1$):

	\mathbf{y}	h_1	h_2	h_3	h_4
\mathcal{N}	0	0	0	1	1
	0	1	0	0	1
	0	1	1	0	0
	0	1	1	1	0
\mathcal{P}	1	1	0	1	1
	1	1	0	0	1
	$ \mathcal{A}_h $	1	2	2	2
	$ \mathcal{B}_h $	0	2	1	0
	\mathcal{U}_h	1	0	1	2

- $\mathcal{R} \leftarrow \{h_4\}$
- $\mathcal{N} \leftarrow \mathcal{N} \setminus \mathcal{A}_{h_4}$
- $\mathcal{P} \leftarrow \mathcal{P} \setminus \mathcal{B}_{h_4}$

Set covering machine: example (2)

	\mathbf{y}	h_1	h_2	h_3
\mathcal{N}	0	0	0	1
	0	1	0	0
\mathcal{P}	1	1	0	1
	1	1	0	0

Set covering machine: example (2)

	\mathbf{y}	h_1	h_2	h_3
\mathcal{N}	0	0	0	1
	0	1	0	0
<hr/>				
\mathcal{P}	1	1	0	1
	1	1	0	0
	$ \mathcal{A}_h $	1	2	1

Set covering machine: example (2)

	y	h_1	h_2	h_3
\mathcal{N}	0	0	0	1
	0	1	0	0
<hr/> <hr/>				
\mathcal{P}	1	1	0	1
	1	1	0	0
	$ \mathcal{A}_h $	1	2	1
	$ \mathcal{B}_h $	0	2	1

Set covering machine: example (2)

	y	h_1	h_2	h_3
\mathcal{N}	0	0	0	1
	0	1	0	0
<hr/>				
\mathcal{P}	1	1	0	1
	1	1	0	0
	$ \mathcal{A}_h $	1	2	1
	$ \mathcal{B}_h $	0	2	1
	\mathcal{U}_h	1	0	1

- We have finished the job: $\mathcal{N} = \emptyset$
- Early stopping: $|\mathcal{R}| \geq s$ with parameter $s \geq 1$
- There remains only useless rules: $|\mathcal{A}_h| = |\mathcal{B}_h| = 0$

- Each greedy step is fast to compute:
 - ▶ Let $\mathcal{I}_{\mathcal{N}}$ be the (current) indices of the negative examples.
 - ▶ $|\mathcal{A}_h| = |\mathcal{I}_{\mathcal{N}}| - \sum_{i \in \mathcal{I}_{\mathcal{N}}} x_{i,j}$ if h is the presence rule of feature j
 - ▶ Similar for $|\mathcal{B}_h|$.

- Each greedy step is fast to compute:
 - ▶ Let $\mathcal{I}_{\mathcal{N}}$ be the (current) indices of the negative examples.
 - ▶ $|\mathcal{A}_h| = |\mathcal{I}_{\mathcal{N}}| - \sum_{i \in \mathcal{I}_{\mathcal{N}}} x_{i,j}$ if h is the presence rule of feature j
 - ▶ Similar for $|\mathcal{B}_h|$.
- Overall complexity $\mathcal{O}(|\mathcal{R}|ns)$

- Each greedy step is fast to compute:
 - ▶ Let $\mathcal{I}_{\mathcal{N}}$ be the (current) indices of the negative examples.
 - ▶ $|\mathcal{A}_h| = |\mathcal{I}_{\mathcal{N}}| - \sum_{i \in \mathcal{I}_{\mathcal{N}}} x_{i,j}$ if h is the presence rule of feature j
 - ▶ Similar for $|\mathcal{B}_h|$.
- Overall complexity $\mathcal{O}(|\mathcal{R}|ns)$
- Limited memory usage

SCM is a *sample compression algorithm*

- Given a model f learnt by an SCM, there exist
 - ▶ a set of individuals $\mathcal{Z} \in \{1, \dots, n\}$
 - ▶ a message string σ containing additional information, such that h can be reconstructed from \mathcal{Z} .

SCM is a *sample compression algorithm*

- Given a model f learnt by an SCM, there exist
 - ▶ a set of individuals $\mathcal{Z} \in \{1, \dots, n\}$
 - ▶ a message string σ containing additional information, such that h can be reconstructed from \mathcal{Z} .
- Then there exists a bound on the risk

$$R(h) = \mathbb{E}_{(\mathbf{x}, y) \sim D} [\mathbb{1}_{f(\mathbf{x}) \neq y}] .$$

SCM is a *sample compression algorithm*

- Given a model f learnt by an SCM, there exist
 - a set of individuals $\mathcal{Z} \in \{1, \dots, n\}$
 - a message string σ containing additional information, such that h can be reconstructed from \mathcal{Z} .
- Then there exists a bound on the risk

$$R(h) = \mathbb{E}_{(\mathbf{x}, y) \sim D} [\mathbb{1}_{f(\mathbf{x}) \neq y}] .$$

- Marchand and Sokolova (2006) established that:

$$\mathbb{P}(\forall S \sim D, \forall h, R(h) \leq \varepsilon(h, S, \delta)) \geq 1 - \delta$$

- ε depends on \mathcal{Z} and the of classif. errors made on $S \setminus \mathcal{Z}$.
- ε does not depend on p .

Consequences:

- The bound does not depend on p : theoretical performance guarantee
- It can be used for hyperparameter selection (Marchand et Shawe-Taylor, 2002).

- Set covering machine
 - ▶ learns a boolean conjunction of SNPs
 - ▶ runs fast
 - ▶ does not suffer from $p \gg n$
- However there are other issues:
 - ▶ Many SNPs can have same \mathcal{U}_h : which one to choose?
 - ▶ Only conjunctions of SNPs

THANK YOU
